Software engineer building identity and access management (IAM) applications for the Department of Veterans Affairs. Combines full-stack development with technical discussions and demos for customer leadership, user acceptance testing, and applied machine learning research.

Professional Experience

Software Engineer

May 2025 - Present

Hybrid Enterprises LLC | Saint Cloud, FL | Department of Veterans Affairs client

Develop IAM applications using Java, JavaScript, Struts, InterSystems IRIS, and REST APIs.

- Built the frontend and backend of a site reassignment application and performed initial testing before QA and user acceptance testing; reduced turnaround from approximately 1-3 days to immediate changes for coordinators nationwide.
- Assess technical feasibility and outline implementation approaches directly with VA and business leadership in weekly technical vetting calls; deliver weekly live demonstrations of completed work.
- Tested and troubleshooted a partner API integration for onboarding existing users with business-specific roles and permissions before software QA; participated in weekly partner progress meetings.
- Support user acceptance testing by preparing test users, troubleshooting issues with business partners, and incorporating their feedback before applications move to production.
- Collaborated with another developer on a production configuration tool used by 55+ people to toggle application functionality without a new build, avoiding rollback builds and associated approval delays.
- Created a live dashboard using a custom audit table to visualize and compare historical and current business-partner API payloads.

Undergraduate Research Assistant

May 2023 - May 2025

Hydride Laboratory, University of Central Florida | Orlando, FL

- Applied automated hierarchical clustering and principal component analysis to colorimetric data from Raspberry Pi camera input, achieving 80%+ correct identification of volatile organic compounds (VOCs).
- Used Python and Jupyter Notebook for exploratory data analysis and visualization of paper-and-graphite sensor tests for wearable technologies; presented research progress weekly.

Client Project

Product Owner | Automated Scorecard Reader and Calculator

Aug 2024 - May 2025

University of Central Florida | South Eastern Distance Riders Association client

- Collaborated with five teammates to deliver an OCR web application that reads and scores equestrian scorecards from phone-camera images; demonstrated and handed over the application to the association.
- Created frontend mockups and implemented the interface using React and Tailwind CSS. Met directly with the client, observed competition use, and incorporated feedback to improve usability for non-technical users.
- Tested the application across outdoor lighting conditions to evaluate image preprocessing adequacy; created tutorial documentation and an FAQ to support user adoption.

Education

Bachelor of Science in Computer Science | University of Central Florida | May 2025

Machine learning coursework: wine quality analysis using logistic regression on a Kaggle dataset.

Finalist, University of Central Florida Senior Design Showcase | May 2025

Technical Skills

Languages: Python, Java, JavaScript, SQL, HTML, CSS

Development: React, REST APIs, Struts, Spring Boot, InterSystems IRIS, Tailwind CSS, Git, Jest

Analysis and design: Jupyter Notebook, Power BI, Figma
